

The Value of Hepatitis C Cure for People Who Inject Drugs

People who inject drugs found that HCV treatment had a positive impact on:

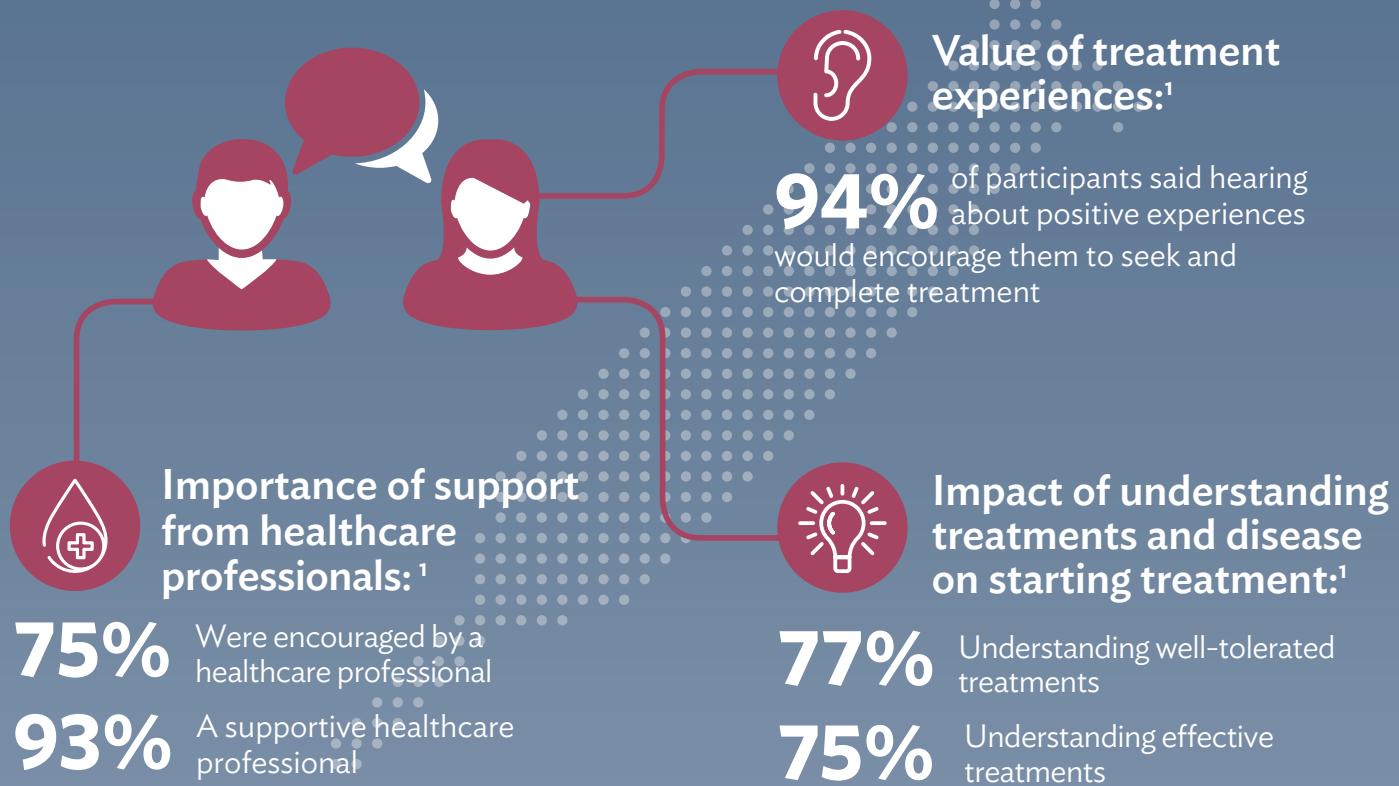

New research has found that the benefits of HCV treatment for people who inject drugs and cure go beyond clinical outcomes (such as liver health) and are linked to improved overall wellbeing and engagement in wider society.¹

Even though advances in science and treatment options have made HCV cure widely accessible, people who inject drugs often experience barriers to care such as...

Meaningful engagements with healthcare providers and peers encourage people who inject drugs to seek care.

About this research:

The survey was conducted by Gilead in partnership with clinical community experts to help better understand people who inject drugs. It was administered online to 124 people who inject drugs, all of whom had injected opioids or stimulants (currently or in the past) and had completed treatment with direct-acting antivirals. Participants came from across Europe: France, Germany, Italy, Spain, Portugal, Switzerland, and the United Kingdom.
